Conflict of Interest and Its Impact on Organizational and Academic Processes

Keywords:

Conflict of interest, business process, conflict management, work environment, academic environment, teamwork, decision-making, workplace issues, conditional clauses, adverbial clauses.

Thesis Statement:

Conflicts of interest arise when personal, professional, or academic interests interfere with an individual's duties and responsibilities within an organization. Although sometimes inevitable, this type of conflict can significantly affect both business and academic processes, generating negative consequences for outcomes and team dynamics. Through an argumentative analysis of a common situation in the academic field, this essay will demonstrate how poor conflict-of-interest management can harm objectivity, collaboration, and overall performance. According to Hernández Sampieri (2014), objectivity in processes is essential for ensuring fair and transparent decisions, and any emotional or personal interference can compromise this principle.

Main Body:

In any collaborative setting, it is natural for differing opinions to arise. However, when these differences lead to a conflict of interest, the

effects can be significant. For instance, in an academic context, imagine a student assigned as the leader of a work team. If this student chooses to prioritize the ideas of their personal friends within the group and unfairly dismisses the proposals of other team members, a clear conflict of interest arises.

Reporting example: *The teacher explained that if the team leader continued to ignore valuable contributions from the rest of the group, the project would not achieve its goals.*

Adverbial clause: *Although the team members had different backgrounds, they tried to work together to overcome the disagreement.*

Conditional clause: *If the leader had taken into account everyone's opinion equally, the outcome would have been more balanced.*

In such situations, team members who feel excluded may experience frustration and a lack of motivation. In other words, they become **disappointed**, while the overall situation becomes **discouraging**.

This not only affects group performance, but also creates a tense and uncooperative environment.

A similar conflict occurred during one of my own academic processes. In a collaborative project for a core subject, the teacher allowed students to choose their own teams. One student, who had a close relationship with the teacher, took on the role of coordinator.

Very quickly, this person began assigning the most complex tasks to those outside their inner circle, justifying it as an “equal distribution.”

However, this caused frustration and complaints to the teacher, affecting the project's development and the team's motivation.

This situation involved various stages of the academic process: planning, execution, and control. Planning was biased, execution was unequal, and control had to be altered by the teacher's intervention to manage the conflict.

Conclusions:

If not identified and managed properly, conflicts of interest can disrupt natural processes in both academic and professional settings, compromising fairness and efficiency.

Assertive communication and clarity in team roles are essential to prevent this type of conflict.

It is necessary to promote a culture of transparency and mutual respect that allows conflicts of interest to be identified and corrected before they cause serious consequences to the group or organization.
